Re

Homo sapiens,

```
UX-S3 is one example of a plasminogen activator which differs from natural human pro-urokinase at positions 153 and 155. (Leu substituted by Asn; Pro substituted by Thr, respectively). The derivative has decreased susceptibility to thrombin compared to natural type pro-UK and higher specific activity. See also AAQ10168 and AAQ10169
                                                                                                                                                                                                                                                                                                                                                                                                                             KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 107
                                                                                                                                                                                                   New plasminogen activator almost identical to natural pro:urokinase - is thrombin resistant and used for prophylaxis-treatment of cerebral thrombosis or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                            1 KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN

```
New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain, (ii) at least part of the first loop and at least part of the Second loop, or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while retaining the same properties as those of hPUK. They have potent thrombolytic activity and vary little tendency to cause spontaneous bleeding. The present sequence is that of the wild-type hPUK protein, including the EGF domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human pro-urokinase variants - deficient in loop regions of epidermal growth factor, showing long blood half-life, as fibrinolytic agent.
                                                                                                                                                                                                        Human; prourokinase; hPUK; variant; half-life; increase; EGF;
epidermal growth factor domain; deletion; thrombolysis; fibrinolysis.

UK-T4 is one example of a plasminogen activator which differs from natural human pro-urckinase at positions 153 and 155 (Leu substituted by Ser, Pro substituted by Thr, respectively). The derivative has decreased susceptibility to thrombin compared to natural type pro-UK and higher specific activity. See also AAQ10168 and AAQ10170
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New plasminogen activator almost identical to natural pro:urokinase - is thrombin resistant and used for prophylaxis-treatment of cerebral thrombosis or myocardial infarction.

The modification puts an epidermal growth factor domain into the protein, containing the sequence Asn-X-Ser or Asn-X-Thr where X is any residue. Plasmid pHR24 is disclosed as containing the modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human pro-urokinase variant - produced by recombinant methods, showing increased half life in blood and high affinity for fibrin.

The modification puts an epidermal growth factor domain into the protein, containing the sequence Asn-X-Ser or Asn-X-Thr where X is any residue. Plasmid pHR22 is disclosed as containing the modified

                        By forming a precursor-lipid composite, the half-life of this thrombolytic agent in the blood may be increaced, exhibiting improved activity without abnormal acceleration of fibrinolytic activity. Compound is useful as a thrombolytic agent in treatment of cerebral thrombosis, myocardial infarction etc

                                                                                                                 Vector contg pro-urokinase encoding gene - includes mouse=1gG H chain E-
mu enhancer, enhancer contg. SV40, early phase promoter and SV40
                                                                                                                                                                                                                                                                                                                                                                            09
                                                                                                                                                                                       The sequence is that of mature prourokinase having the sustitution mutations F157D and K1350. The sequence per se is not given in the specification, so the known sequence of prourokinase was used to demonstrate the mutant protein. The gene encoding prourokinase has been over-expressed by recombinant DNA technology and provides a method for the rapid, low cost produ. Of prourokinase, which is a low mol. Wt. plasminogen activator used for dissolving blood clots. See also AAR23794
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ...... purential cleavage site which generates the two-
chain form from the zymogen"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence encoded by cDNA sequence for human urokinase zymogen (Japanese Patent Application No.37119/84).
                                                                                                                                                                                                                                                                                                                                                                            1 KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN

                                                                                                                                                                                                   Zymogen AAP50871 is the inactive precursor form of human urokinase. Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular w.c. of 30,000) and L (molecular w.c. of 30,000) chains when treated with catalytic amounts of plasmin. The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It at thrombolytic agent which manifests its plasminogen activator activator activity on cleavage by proteolytic enzymes (e.g. plasmin) and has higher affinity for fibrin than known forms of urokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 107

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPA). The composition is used to modulate the contractility and angiogenic activity of a mammalian unscide, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microanglopathies, surgically induced thrombotic invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, disorders, angiogenic disorders, tumour cell metastasis, glaucoma, charaction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (UPA) single chain urokinase (scupA) deletion mutant designated as scupA deltal36-143
                                                                                                                                                                                                                       Human; urokinase-type plasminogen activator; uPA; therapy; hypertension; arroke, hypotensian, stroke, hypotensian, arroke, therobotic disordar; microvascular occlusion; angiogenic disorder; pulmonary fibrosis; asthma; tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clotting disorder; uterine contraction disorder; respiratory disease; male impotence; adult respiratory distress syndrome; scupA deltal36-143; single chain urokinase; mutent; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is that of mature prourokinase having the sustitution mutation F157D. The sequence per se is not given in the specification, the known sequence of prourokinase was used to demonstrate the mutant protein. The gene encoding prourokinase has been over-expressed by recombinant DNA technology and provides a method for the rapid, low cos produ. of prourokinase, which is a low mol. wt. plasminogen activator used for dissolving blood clots. ```
New variants of human prourokinase (hPUK) comprise a hPUK deficient in (i) at least part of the first loop region of the epidermal growth factor (EGF) domain, (ii) at least part of the first loop and at least part of the second loop; or (iii) at least part of the third loop. The hPUK variants show an increased blood half-life comparable to that of the whole EGF domain-deficient hPUK variant and urokinase while rectaining the same properties as those of hPUK. They have potent thrombolytic activity and very little tendency to cause spontaneous bleeding. The present sequence represents a specific variant of hPUK which lacks EGF domain or the properties of the properties are specific variant of hPUK which lacks EGF domain the properties as those properties are part of the properties as those properties are properties as those the properties as those properties as those the properties as the properties as those the properties as the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   loop 3; the sequence does not appear in the specification and has been created using the wild-type hPUK sequence and the junction sequence after deletion, both of which are given (in Fig 1 and on page 8, respectively)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            38 KTCYEGNGHFYRGKASTDIMGRPCLPWNSAIVLQQIYHAHRSDALQLGLGKHNYCRNPDN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR6644-R66266 are specific examples of such derive. which have both improved ibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or birombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      XTCYEGNGHFYRGKASTDTMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 60

                                                                                                                                                                                                                                                                                                                                                                                               Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 examples of see features table). Sequences AAR66244-R66266 are specific examples of such derives, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)

Sequences (AAQS5711-72) are pro-urokinase derivatives. The products have an inserted sugar moeity having an amino acid substituted, depleted or inserted variant around the thrombin cleavage site. They also have a long half-life allowing them to be used in the treatment of thrombosis
                                                                           Pro-urokinase; half-life; thrombolytic; thrombosis; fibrinolytic; factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            KTCYEGNGHFYRGKASTDTMGRPCLPWNSAIVLQQTYHAHRSDALQLGLGKHNYCRNPDN 91

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                            Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such deriver, which have both improved fibrinollytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, and cerebral infarction and pulmonary about thrombosis, cardiac to correct PN field.)

New peptides (I) with fibrinolytic and anticoagulant activity comprise a plasminogen-activating amino acid sequence (A) fused at the N- and/or C- terminus to a thrombin and/or factor Xa inhibiting amino acid sequence (B). Excluded from the claims are (I) where (A) is Ser47 to Leu411 of unglycosylated urokinase linked at the C-terminus to sequences (i) to (iii): TI-RPP-12-GGGGGGDEEDERIAL PROPEXEPEREPERENCE (Iii) Where Tl= P or V; T2 = L or a bond; T3 = Q or T1-RPSERFEREIDEERK (Iii) Where Tl= P or V; T2 = L or a bond; T3 = Q or OH (A) is pref. (pro)urokinase; tissue plasminogen activator (tPA), bat-CC T1-RPSERFEREIDEERK (Iii) where T1= P or V; T2 = L or a bond; T3 = Q or OH (A) is pref. (pro)urokinase; and/or APSAC (anisolated plasminogen activator complex), septention; insertion and/or addn.); streptokinase activator complex), esp. prourokinase (411 amino acids) or streptokinase activator complex), esp. prourokinase (411 amino acids) or tis Ser9Arg to S27Pro or APSAC (anisolated plasminogen or tis derived from the human thrombin activities; or is derived from the human thrombin receptor, antistatin and/or the tick anticoagulant peptide. Most pref. Care the 65 amino acid hirudin sequence or one of the six sequences given in AAR99879 to AAR99884. Plasmids pwLT27 (MS1), pwS1 (MS1), pSS8 (M36) and pHWS6 (M31) contain the sequences encoding AAR99885 to AAR99888; respectively. The products were tested in human citrated plasma (5 microg in 200 microl 1:10 diluted plasma). The thrombin time was then 1.2, 3, 2.2, and 1.2 times greater, repectively, than in the absence of the
                                                                                                        Thrombin, factor Xa, anticoagulant, thrombolytic; plasminogen, urokinase, activator; streptokinase, staphylokinase, APSAC, antisolated plasminogen streptokinase activator complex; hirudin; hirulin, antistatin; pWL127; pWS1; pSE8; pHWS6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Proteins with fibrinolytic and anticoagulant activity - useful
                                                                      M36: fibrinolytic and anticoagulant activity contg. protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure, Fig 18; 59pp; German.

Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R6656 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activities or thrombin inhibitors. The proteins are useful as thrombolytic agents, egg for treatment of arterial occlusions, deep vein thrombolytic agents, and carebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Chimeric protein contg. plasminogen activating sequence and thrombin-
inhibiting sequence - useful as thrombus-specific thrombolytic agent with
rapid action.
New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                     Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive. Which have both improved fibrinollytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-WAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac

Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives, which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PM field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac acerebral infarct, pulmonary embolism, etc.

Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244.R66266 are specific examples of such derivs. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac scerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                          1. .365

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardac and cerebral infarction and pulmonary embolism. New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                   Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see fearures table). Sequences AAK66244 R66266 are specific examples of such derive. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive. which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism.                                                                                                                                                                                                                                                                                                                                                                                                     New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombolytic agents, and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN file1d.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN 60

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derive. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, eag for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PM field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 KTCYEGNGHFYRGKASTDIMGRPCLPWNSATVLQQTYHAHRSDALQLGLGKHNYCRNPDN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1. .365
